

iAsync Functional Programming in Objective-C

Alexander Dodatko
2013

Over 900,000 apps

(as of June 2013)

```
NSData* jsonData = nil;  
jsonData = [ NSData dataWithContentsOfURL: RESOURSE ];
```

A cartoon illustration of a white horse with black stripes. The horse is facing left, with its head turned slightly towards the viewer. It has a red speech bubble coming from its mouth. The speech bubble contains the text "That's not good".

That's not
good

Asynchronous Programming

```
@protocol NSURLConnectionDataDelegate  
<NSURLConnectionDelegate>
```

```
@optional
```

```
- (void)connection: didReceiveResponse:
```

```
- (void)connection: didReceiveData:
```

```
- (void)connectionDidFinishLoading:
```

```
- (void)connection: didFailWithError:
```

```
@end
```

Too Much Code

Objectice-C Blocks

NS_AVAILABLE(10_7, 5_0);

+ (**void**)sendAsynchronousRequest:
queue:
completionHandler:

```
void (^HANDLER_BLOCK)(  
    NSURLResponse* response,  
    NSData* data,  
    NSError* connectionError)
```

Cancel

The logo features a stylized white flame graphic against an orange background. The flame is composed of several sharp, upward-pointing white shapes. Below the flame is a red rectangular base. Inside the red base, the letters "AFN" are written in large, bold, white, sans-serif capital letters.

AFN

Dependencies

When using methods which return blocks they can be very convenient. However, when you have to string a few of them together it gets messy really quickly

```
[remoteAPIWithURL:url1 success:^(int status){  
    [remoteAPIWithURL:url2 success:^(int status){  
        [remoteAPIWithURL:url3 success:^(int status){  
            [remoteAPIWithURL:url2 success:^(int status){  
                //success!!!  
            }];  
        }];  
    }];  
}];
```

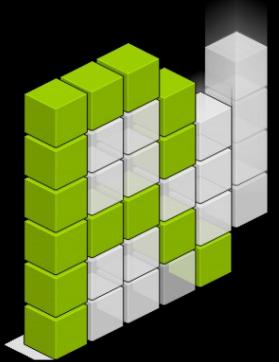

It was not uncommon when using AFNetworking in Gowalla to have calls chained together in success blocks. My advice would be to factor the network requests and serializations as best you can into class methods in your model. Then, for requests that need to make sub-requests, you can call those methods in the success block.

Callback Hell

```
- (void)suspendURLIfDownloading:(NSURL *)url automaticallyResumeLater:(BOOL)autoResume
{
    [_session getTasksWithCompletionHandler:^(NSArray *dataTasks, NSArray *uploadTasks, NSArray *downloadTasks) {
        [downloadTasks enumerateObjectsUsingBlock:^(id obj, NSUInteger idx, BOOL *stop) {
            NSURLSessionDownloadTask *task = (NSURLSessionDownloadTask *)obj;
            if ([task.originalRequest.URL.absoluteString isEqualToString:url.absoluteString]) {
                *stop = YES;
                [task cancelByProducingResumeData:^(NSData *resumeData) {
                    [_queue addOperationWithBlock:^{
                        [_db executeUpdate:
                            @"UPDATE FCDownloadQueue SET state = ?, resumeData = ? WHERE url = ?",
                            @( autoResume ? FCDownloadStatePausedAutoResume : FCDownloadStatePausedDoNotAutoResume ),
                            resumeData ? resumeData : [NSNull null],
                            url.absoluteString
                        ];
                        [self.delegate downloadQueue:self didPauseDownloadingURL:url userInfo:[self userInfoForURL:url]];
                        [self ensureEnoughDownloadsAreRunning];
                    }];
                }];
            }
        }];
    }];
}
```

Working with independent data sets in parallel and then combining them into a final result is non-trivial in Cocoa, and often involves a lot of synchronization

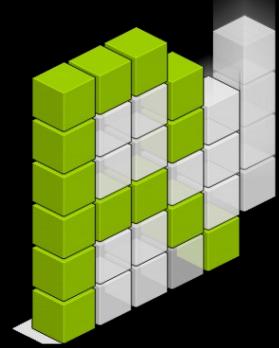

```
block NSArray *databaseObjects, fileContents;
NSOperationQueue *backgroundQueue = [[NSOperationQueue alloc] init];
NSBlockOperation *databaseOperation = [NSBlockOperation blockOperationWithBlock:^{
    databaseObjects = [databaseClient fetchObjectsMatchingPredicate:predicate];
}];
```

```
NSBlockOperation *filesOperation = [NSBlockOperation blockOperationWithBlock:^{
    NSMutableArray *filesInProgress = [NSMutableArray array];
    for (NSString *path in files) {
        [filesInProgress addObject:[NSData dataWithContentsOfFile:path]];
    }

    fileContents = [filesInProgress copy];
}];
```

```
NSBlockOperation *finishOperation = [NSBlockOperation blockOperationWithBlock:^{
    [self finishProcessingDatabaseObjects:databaseObjects fileContents:fileContents];
    NSLog(@"Done processing");
}];

[finishOperation addDependency:databaseOperation];
[finishOperation addDependency:filesOperation];
[backgroundQueue addOperation:databaseOperation];
[backgroundQueue addOperation:filesOperation];
[backgroundQueue addOperation:finishOperation];
```

Rather than using mutable variables which are replaced and modified in-place, RAC provides signals (represented by `RACSignal`) that capture present and future values.

Self-loading properties

When Design Patterns are NOT enough

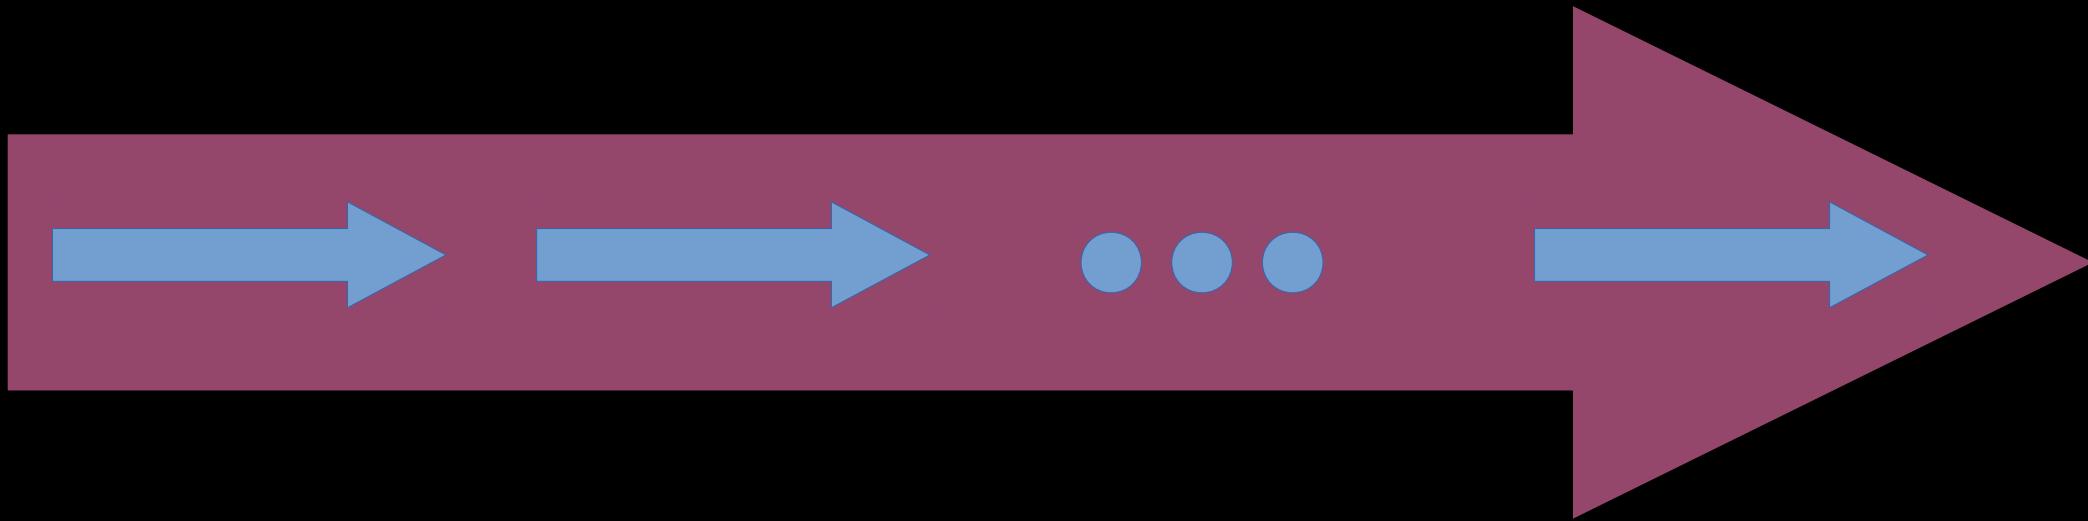

Meet the Async Operation

```
CancelBlock (^AsyncOperation)  
  ( ProgressCallback,  
    CancelCallback,  
    CompletionCallback ) {...};
```

Completion Callback

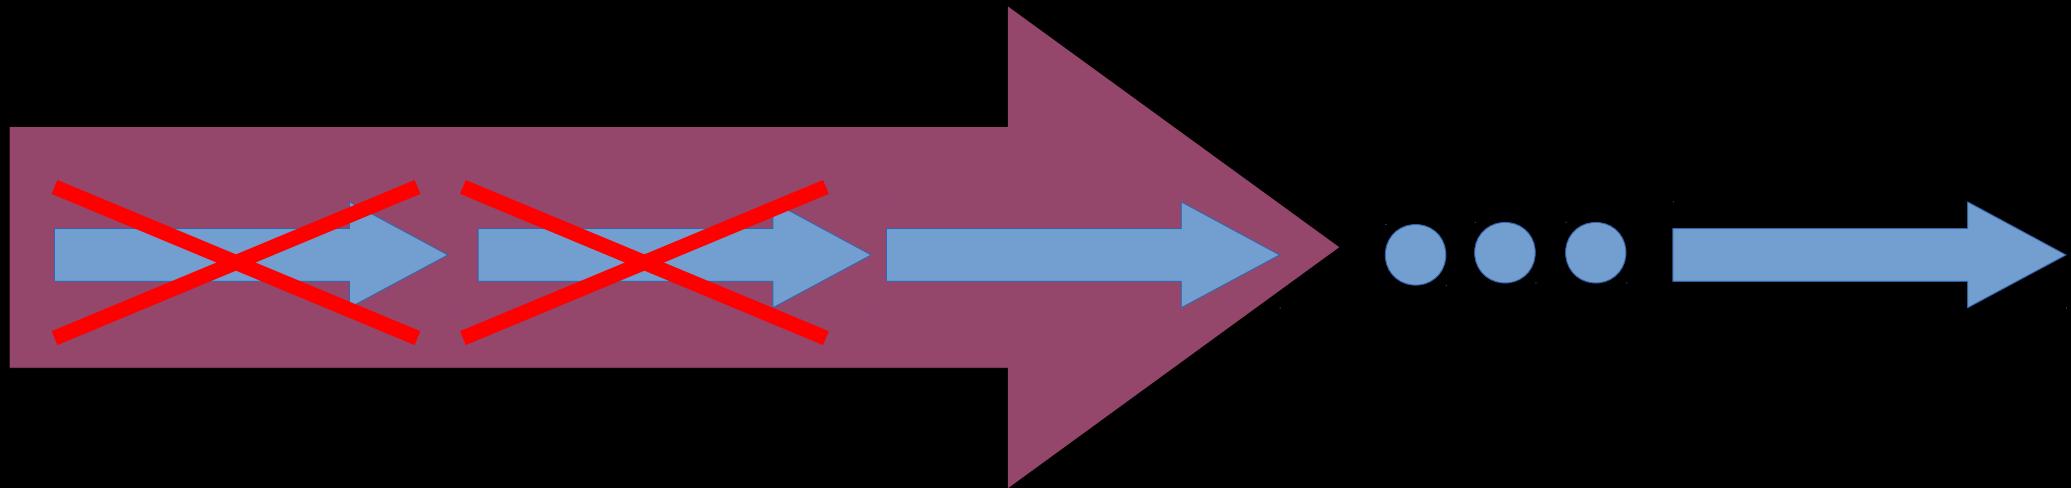

```
void (^CompletionCallback)(  
    id operationResult,  
    NSError* operationError)
```

Sequence

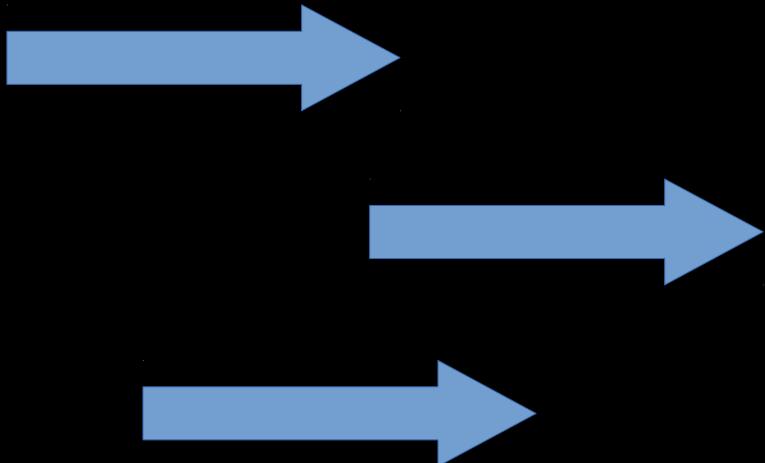

```
JFFAsyncOperation sequence =  
    sequenceOfAsyncOperations(  
        @[ op1, op2, opN ] );
```

Sequence of Attempts

```
JFFAsyncOperation sequence =  
trySequenceOfAsyncOperations(  
    @[ op1, op2, opN ] );
```

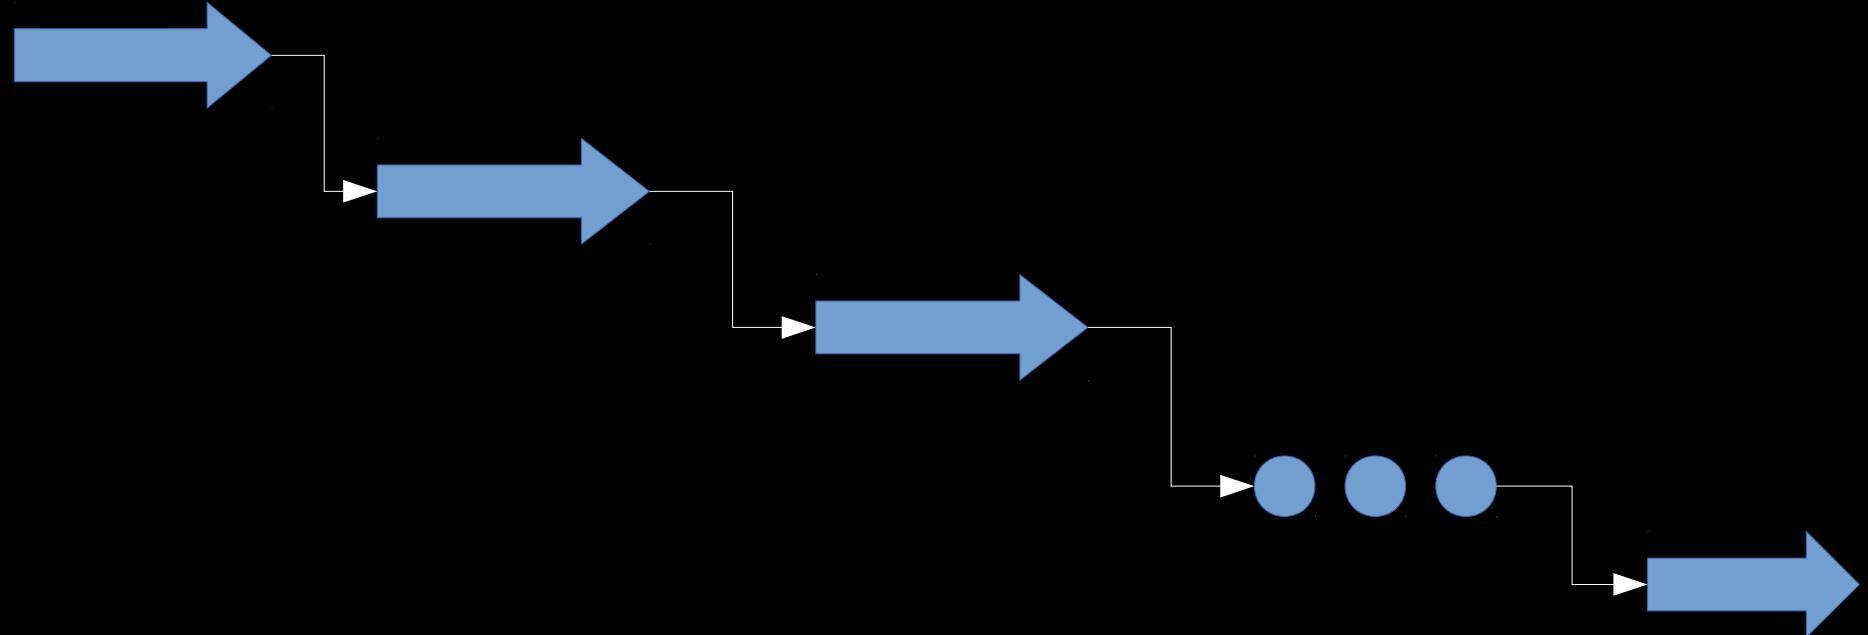

Parallel execution

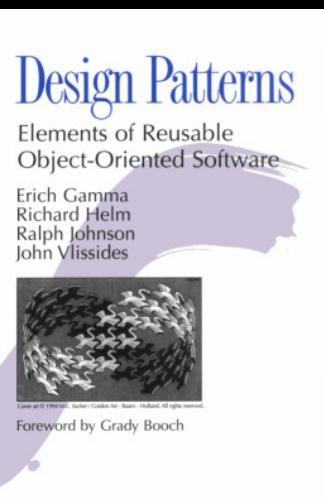

CompletionCallback

```
JFFAsyncOperation sequence =  
groupOfAsyncOperations(  
@[ op1, op2, opN ] );
```

Waterfall

JFFAsyncOperation **sequence** =
bindSequenceOfAsyncOperations(
 opl, @[b1, b2, bN]);

Function = Command + Composite

Any Complexity Tasks

```
loadFromNet = sequenceOfAsyncOperations(  
@ [ login, loadFromNet ] );
```

```
loadRawData = trySequenceOfAsyncOperations(  
@ [ loadFromFSCache, loadFromNet ] );
```

```
JFFAsyncOperation getData =  
bindSequenceOfAsyncOperations(  
loadRawData, @ [ parseBinder, filterBinder ] );
```

Demo
